According to our (Global Info Research) latest study, the global Plastic Laser Welding System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Non-contact laser welding offers several advantages when it comes to joining one plastic part to another. It works on the principle of partial transmission which lets a laser's light travel through one of the plastic parts to create heat and fuse or weld it to a second plastic part. The finished weld is contained between the parts. There is also no contact between the fused area and the heat source or atmosphere, so the finished joint is clean. Conventional plastic welding techniques such as ultrasonic and hot stamping, on the other hand, require contact with the outer surfaces of the parts being joined, and this can contaminate the joint and the parts' surfaces or mechanically damage the assembly.
