Abstracts

The global Plastic Laser Welding System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Non-contact laser welding offers several advantages when it comes to joining one plastic part to another. It works on the principle of partial transmission which lets a laser's light travel through one of the plastic parts to create heat and fuse or weld it to a second plastic part. The finished weld is contained between the parts. There is also no contact between the fused area and the heat source or atmosphere, so the finished joint is clean. Conventional plastic welding techniques such as ultrasonic and hot stamping, on the other hand, require contact with the outer surfaces of the parts being joined, and this can contaminate the joint and the parts' surfaces or mechanically damage the assembly.

This report studies the global Plastic Laser Welding System production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Plastic Laser Welding System, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
