Abstracts

The global Plastic Mooring Buoy market size is expected to reach \$ 249 million by 2032, rising at a market growth of 3.1% CAGR during the forecast period (2026-2032).

Plastic Mooring Buoy is a floating mooring device made primarily from polyethylene, polyurethane, composite plastic, or other polymer-based materials, used to secure or position vessels, floating facilities, aquaculture structures, nearshore platforms, or other marine assets. It is typically connected to the seabed through chains, ropes, shackles, swivels, sinkers, or anchoring systems, providing a visible, connectable, and load-bearing mooring point on the water surface. Its core function is to maintain buoyancy and positional stability while withstanding wind, waves, currents, and mooring loads, with plastic materials providing advantages such as corrosion resistance, light weight, and low maintenance. The unit price of Plastic Mooring Buoy typically ranges from several hundred to several thousand US dollars, and the industry's gross profit margin is usually between 20% and 40%.

The upstream supply chain of Plastic Mooring Buoys mainly includes suppliers of polyethylene resin, polyurethane foam, elastomers, color masterbatch, UV stabilizers, metal connectors, chains, ropes, shackles, swivels, reflective materials, and marine lanterns. The midstream segment consists of manufacturers engaged in buoy design, rotational molding, foam filling, steel core or connection structure assembly, surface finishing, buoyancy testing, and mooring system integration. Downstream customers include port and terminal operators, marina operators, aquaculture companies, maritime authorities, marine engineering contractors, navigation maintenance organizations, and nearshore facility operators. Since different applications require different buoyancy levels, load capacities, visibility, weather resistance, and connection methods, the supply chain depends not only on plastic processing capability, but also on engineering

design, mooring configuration, and installation service capabilities.

The Plastic Mooring Buoy market is a lightweight, corrosion-resistant, and relatively standardized segment within the broader mooring buoy industry. Demand is mainly driven by ports, marinas, coastal facilities, aquaculture sites, navigation support systems, and small to medium marine engineering applications. Compared with steel mooring buoys, plastic mooring buoys offer advantages in corrosion resistance, easier handling, lower maintenance requirements, and better suitability for batch production, making them attractive for nearshore and medium-load applications. However, their use in heavy-duty offshore and large-vessel mooring remains limited by load-bearing capacity and structural strength requirements. Future market competition is expected to focus on material durability, buoyancy retention, impact resistance, UV resistance, customization capability, and overall lifecycle cost.
