According to our (Global Info Research) latest study, the global Plastic and Rubber Liquid Cooling Hose market size was valued at US\$ 3183 million in 2025 and is forecast to a readjusted size of US\$ 5916 million by 2032 with a CAGR of 9.4% during review period.

As an important component of new energy vehicles, hybrid vehicles, fuel vehicles, data centers and energy storage systems, liquid cooling pipelines need to meet multiple requirements such as hydrolysis resistance, oil resistance, high temperature resistance, and lightweight. As a key channel for the flow of liquid cooling media, liquid cooling pipes must not only be integrated into the flow and flow resistance distribution mechanism of the entire liquid cooling system, but also undertake the task of providing a convenient connection interface for external liquid cooling equipment. When selecting liquid cooling pipelines inside IT equipment, multiple key factors must be considered comprehensively to ensure the efficient and stable operation of the system. This includes but is not limited to the compatibility between materials to ensure the harmonious coexistence of the pipeline and the working environment; control the flow rate within a reasonable range, especially the flow rate in flexible pipes should be maintained below 1.5 m/s to reduce pressure loss and vibration; carefully plan the layout of the pipe to optimize space utilization and reduce resistance caused by bending; determine the appropriate installation method for easy maintenance and upgrading; accurately design the flow distribution to ensure that each component is cooled evenly; and ensure the reliability of the pipeline to cope with various challenges in long-term operation. Liquid cooling pipes can be divided into metal materials and plastic (plastic, rubber) materials according to the material. The statistical scope of this report is plastic liquid cooling pipelines.

In the era of fuel vehicles, nylon pipes were mainly used for fuel lines and fuel evaporation lines of automobiles, and were basically not used in air conditioning. The main reason was that on the one hand, the temperature in the front cabin of the engine was high, and the heat resistance of nylon pipes was limited, so they were easy to melt and cause safety problems. On the other hand, the vibration amplitude of the engine of a fuel vehicle is large, and the vibration resistance of plastic pipes is weaker than that of rubber pipes, so the service life and failure rate are difficult to guarantee. In the era of new energy vehicles, in order to shorten the development time and efficiency in the early days, and designers are more familiar with the rubber pipe system, most of them still use rubber pipe design. With the continuous iteration of the solution, nylon pipes have been widely used in power systems and three-electric systems, and have gradually penetrated into air-conditioning systems.
