The global Plastic Winding Machine market size is expected to reach \$ 508 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

In 2025, global plastic winding machine production reached approximately 125,000 units. Plastic Winding Machine is a specialized piece of equipment used to continuously wind plastic wires, pipes, films, or strips into coil-shaped products with controlled tension and precise alignment. The machine typically operates through a coordinated system of a driven winding unit, tension control system, and guiding device, ensuring stable material transport during production or processing while achieving neat and tightly wound coils for subsequent storage, transportation, or further processing. Plastic winding machines are widely used in plastic pipe production, wire and cable sheathing, packaging films, and industrial plastic strip applications. They are characterized by high winding efficiency, a high degree of automation, and stable coil quality, making them an important auxiliary equipment in plastic processing and post-processing operations.

The plastic winding machine market has been gradually developing in recent years, driven by the increasing level of automation in the plastic processing industry and the expansion of downstream application fields. As an important piece of equipment in the plastic post-processing stage, it is mainly used for continuous winding and forming of pipes, films, wires, and strips, playing a significant role in plastic product manufacturing and packaging processes.

With the continuous improvement in downstream requirements for production efficiency, coil quality, and automation control, traditional manual or semi-automatic winding methods are being gradually replaced by high-efficiency and intelligent equipment, promoting technological upgrades and wider adoption of plastic winding machines. At

the same time, the development of digital manufacturing and smart factories is driving the equipment toward higher precision tension control, automatic roll change, and system integration.

Overall, although the market size remains relatively limited, demand is stable. Supported by the continuous development of the plastic processing and packaging industries, it shows steady growth. Industry competition is increasingly concentrating on companies with strong capabilities in providing automated system solutions.
