Plate end connector is a kind of hardware used for construction and carpentry, which is used to connect two pieces of wood or wood end to end. As the name implies, it consists of a metal plate, which is fixed at the end of each piece of wood with nails, screws or bolts, and then these plates are fixed together with bolts to form a strong and durable joint. Plate end connectors have different sizes and styles to adapt to different wood sizes and joint configurations, and are usually used for roof frames, floor frames and other structural applications requiring solid and rigid joints. They are generally more popular than other types of end-to-end joints (such as butt joints or butt joints) because they provide better bearing capacity and resistance to lateral forces.
