## Abstracts

According to our (Global Info Research) latest study, the global Plate Forming Machine market size was valued at US\$ 1053 million in 2025 and is forecast to a readjusted size of US\$ 1590 million by 2032 with a CAGR of 6.1% during review period.

A plate forming machine (also known as a plate rolling mill or steel plate rolling machine) is a forming device used to plastically deform metal sheets (mainly steel sheets) through multi-roll pressing, thereby rolling them into cylindrical, conical, or arc-shaped workpieces. Its core principle is to utilize the relative motion and pressure between the upper and lower rollers to gradually bend the sheet into the desired curvature. It is widely used in pressure vessels, wind turbine towers, shipbuilding, petrochemical equipment, and heavy machinery, and is one of the important pieces of equipment for cold forming of sheet metal.

The upstream of the plate forming machine industry chain mainly includes suppliers of steel (such as medium and heavy plates and alloy steel plates), core components (hydraulic systems, CNC systems, motors, bearings, reducers, etc.), and castings and forgings. The midstream consists of plate rolling machine manufacturers, responsible for equipment design, processing, assembly, and system integration; this is the core value link of the industry chain. The downstream is widely used in industries such as pressure vessels, wind power equipment, shipbuilding, petrochemicals, bridge engineering, and heavy machinery. In terms of gross profit margin, the upstream raw materials and general components segments are highly competitive, with gross profit margins typically ranging from 10% to 20%. Midstream complete machine manufacturing, due to higher technological barriers and customization levels, generally has gross profit margins of 20% to 40%, with high-end CNC plate rolling machines

potentially achieving even higher margins. Downstream application companies primarily use the equipment, and their gross profit margins depend on the industry of their end products, generally not relying on the plate forming machine itself as a source of profit.

In 2025, the sales volume of plate forming machine was 2,046 units, with an average price of US\$500 k per unit. The total production capacity of steel plate forming machine in 2025 was 3,000 units.

Plate forming machine, also known as steel plate rolling machine, is an industrial mechanical equipment used to process and curl metal steel plates. It is mainly used to cut, cut to length and curl large steel coils into required sizes and shapes for subsequent manufacturing and construction purposes. As market demands diversify, machine manufacturers may offer more customization options to meet the special requirements of different industries and customers. One of the future trends is to introduce digital technology into steel plate rolling machines, including automated control systems, real-time monitoring and data analysis, to improve the accuracy and efficiency of the production process.
