Plate Type Demagnetizer is a device specially used for demagnetizing metal workpieces. Its design feature is a flat large-area plate-like structure, which is suitable for processing workpieces with large volume or flat surface. The device uses the internally embedded alternating magnetic field technology to quickly eliminate the residual magnetism on the surface and inside of the workpiece, restoring it to a non-magnetic state. This demagnetizer is usually installed on the production line or used alone, and is characterized by high efficiency, stability and easy operation. Plate type demagnetizers are widely used in mechanical processing, automobile manufacturing, electronic assembly and other fields, effectively preventing the influence of magnetism on workpiece precision, electronic component performance and equipment operation, and providing important support for industrial production and product quality control.
