Abstracts

According to our (Global Info Research) latest study, the global Platinum Alloy Catalyst (Pt Alloy/C) market size was valued at US\$ 230 million in 2025 and is forecast to a readjusted size of US\$ 597 million by 2032 with a CAGR of 14.6% during review period.

Platinum Alloy Catalyst (Pt Alloy/C) is a core electrocatalytic material in hydrogen fuel cells (primarily PEMFC cathodes). It consists of platinum alloyed with transition metals (such as cobalt (Co), nickel (Ni), and iron (Fe)) into highly dispersed particles on a carbon support (such as carbon black, carbon nanotubes, and carbon fibers). By optimizing the alloy composition, particle size, support structure, and surface treatment, platinum alloy catalysts significantly reduce Pt consumption per unit power while maintaining high catalytic activity (MA) and durability. It is a crucial technological direction for promoting the commercialization of low-platinum routes, improving fuel cell power density and lifespan, and is also the mainstream solution for PEMFC cathode industrialization. In 2025, global shipments of Platinum Alloy Catalyst (Pt Alloy/C) were approximately 6.135 tons, with a unit price of approximately US\$36,400/kg and a gross profit margin of approximately 4.86%-15.3%.

Platinum alloy catalysts are key materials for hydrogen fuel cells, primarily used in PEMFC cathodes. Their high mass activity, durability, and low Pt loading make them essential for reducing fuel cell system costs, improving power density, and extending operational lifetime. With the rapid growth of fuel cell vehicles (FCVs) and stationary PEMFC systems, coupled with global carbon neutrality policies and hydrogen energy strategies, demand for Pt alloy catalysts continues to rise. At the same time, supply volatility and price fluctuations of platinum and alloy metals (such as Co and Ni), as well as ongoing development of non-precious metal catalysts, remain key market

challenges. Furthermore, industrial-scale production capacity, particle uniformity, catalytic activity, and durability directly influence deployment across automotive, stationary, and research applications. Consequently, low-Pt, high-activity platinum alloy catalysts are poised to become the core enabler for PEMFC commercialization and industrial upgrading, gradually replacing traditional high-Pt load cathodes.
