The global PLC Motion Control Module market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A PLC motion control module is a device that enables a programmable logic controller (PLC) to perform precise and coordinated motion control tasks. A PLC is a type of industrial computer that can execute logic and arithmetic operations based on user-defined programs. A motion control module is an optional module that can be added to a PLC to extend its functionality and interface with various types of motors, drives, encoders, and sensors. A motion control module can generate and receive high-speed pulse signals, perform trajectory calculations, execute motion commands, and provide feedback and error correction for the motion system. A motion control module can be used for applications that require positioning, synchronization, speed control, or torque control of one or more axes of motion.
