Polymethacrylates (PMAs) are used to make viscosity modifiers and pour point depressants, both of which are important ingredients in fluids such as lubricating oils. PMA viscosity modifiers are used to increase the viscosity index of lubricating oils, thereby making the viscosity more stable over a wider temperature range, and are suitable for fluids such as crankcase, powertrain and hydraulic oils. Pour point depressants maintain the fluidity of oils at low temperatures by preventing waxes (which are present in nearly all refined mineral oils) from forming connected crystals that restrict the flow of the fluid. The chemical properties of a specific PMA must be matched to the fluid and the application.
