The global Pneumatic Diaphragm Actuator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A pneumatic diaphragm actuator is a type of actuator that utilizes a flexible diaphragm to convert air pressure into mechanical force. It is commonly used in valve automation to control the opening and closing of valves in various industries.

The diaphragm is usually made of a flexible and durable material such as rubber or elastomer. It separates the actuator's air chamber into two compartments: the top chamber and the bottom chamber. By applying air pressure to either side of the diaphragm, the actuator can create either an opening or closing force.
