Abstracts

The global Pneumatic Shock Absorber market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The structural feature of the pneumatic shock absorber is that a floating piston is installed at the lower part of the cylinder, and a closed air chamber formed by the floating piston and one end of the cylinder is filled with high-pressure nitrogen. A large-section O-ring is installed on the floating piston, which completely separates oil and gas. The working piston is equipped with a compression valve and an expansion valve that change the cross-sectional area of the channel with the speed of its movement. The pneumatic shock absorber is an advanced shock absorber that uses gas compression to achieve shock absorption. Compared with the hydraulic shock absorber, the pneumatic shock absorber has greatly improved the shock absorption effect, control performance and comfort.

This report studies the global Pneumatic Shock Absorber production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Pneumatic Shock Absorber, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
