Abstracts

The global Pneumatic Springs market size is expected to reach \$ 2924.1 million by 2029, rising at a market growth of 3.7% CAGR during the forecast period (2023-2029).

Pneumatic springs are metal bellows filled with compressed air used as an alternative to the metal wire springs used to close valves in high-speed internal combustion engines. These could retract valves more quickly and reduce the possibility of piston-valve interference, as long as pressure could be maintained. Additionally, the amount of seat tension required to keep a coil sprung valve under control results in greater peak lift loading. This results in added stress to the entire valvetrain. Pneumatic systems, sharing a common reservoir of pressure retain a more static level of force, controlling the valve effectively, without any attendant peak lift load increase.

This report studies the global Pneumatic Springs production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Pneumatic Springs, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
