Abstracts

According to our (Global Info Research) latest study, the global PNH and aHUS market size was valued at US\$ 2121 million in 2025 and is forecast to a readjusted size of US\$ 2491 million by 2032 with a CAGR of 2.3% during review period.

PNH and aHUS, both are extremely rare and genetic diseases. Due to PNH, destruction of red blood cells of a person occurs quite sooner than it should. It is an acquired hematopoietic stem cell disorder. Hematopoietic stem cells are developed in bone marrow and eventually turn into red blood cells, white blood cells and platelets. A person with PNH has some defected hematopoietic cells which create defective red blood cells. These defective cells are highly susceptible to premature destruction by the complement system. aHUS is a disorders in which blood clots are formed in small blood vessels throughout the body. TMA can lead to heart stroke, attack, kidney failure and death.

The market for Paroxysmal Nocturnal Hemoglobinuria (PNH) and Atypical Hemolytic Uremic Syndrome (aHUS) is primarily driven by increased awareness and improved diagnostic capabilities for these rare, life-threatening hematologic and renal disorders. Advances in molecular biology and genetic testing have enabled earlier and more accurate diagnosis, leading to timely treatment initiation, which significantly improves patient outcomes. Furthermore, the introduction and approval of novel targeted therapies, such as complement inhibitors (e.g., eculizumab and ravulizumab), have revolutionized the treatment landscape by offering effective disease management options that reduce hemolysis, thrombotic events, and organ damage. Growing investment in research and development, coupled with supportive regulatory frameworks and orphan drug designations, also accelerates the availability of innovative therapies. Additionally, increasing patient advocacy and education programs have

raised disease recognition among healthcare professionals, contributing to market growth.

Despite the promising growth prospects, the PNH and aHUS market faces several challenges that limit broader access and adoption of therapies. One significant barrier is the high cost of treatment, especially with complement inhibitors, which can impose substantial financial burdens on healthcare systems and patients, particularly in low- and middle-income countries. This cost factor often restricts widespread accessibility and reimbursement, limiting patient access to life-saving drugs. Moreover, the rarity of these diseases results in a small patient population, which poses challenges for conducting large-scale clinical trials and hinders extensive data generation for long-term safety and efficacy. Another challenge is the complexity of disease diagnosis due to overlapping symptoms with other hematological or renal conditions, sometimes causing delayed or missed diagnosis. Lastly, the need for lifelong treatment in many cases raises concerns about patient adherence, potential side effects, and the development of resistance, necessitating continuous monitoring and management strategies.
