## Abstracts

According to our (Global Info Research) latest study, the global PNP Bipolar Transistor market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A PNP bipolar transistor is a semiconductor device consisting of three layers of different types of semiconductor materials, in which the doped layer is N-type, and the materials on both sides are P-type. A PNP bipolar transistor has three regions: base, emitter and collector. When the voltage is applied, the current between the emitter and the base will be controlled, thereby affecting the current of the collector and realizing the function of current amplification. Compared with the NPN bipolar transistor, the polarity of the PNP bipolar transistor is opposite, that is, the current flows in the opposite direction, and the voltage is also opposite. In circuit design, different circuit functions can be realized by selecting the appropriate bipolar transistor type and its polarity, as well as a reasonable bias circuit.

This report is a detailed and comprehensive analysis for global PNP Bipolar Transistor market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
