Abstracts

The global PNP Bipolar Transistor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A PNP bipolar transistor is a semiconductor device consisting of three layers of different types of semiconductor materials, in which the doped layer is N-type, and the materials on both sides are P-type. A PNP bipolar transistor has three regions: base, emitter and collector. When the voltage is applied, the current between the emitter and the base will be controlled, thereby affecting the current of the collector and realizing the function of current amplification. Compared with the NPN bipolar transistor, the polarity of the PNP bipolar transistor is opposite, that is, the current flows in the opposite direction, and the voltage is also opposite. In circuit design, different circuit functions can be realized by selecting the appropriate bipolar transistor type and its polarity, as well as a reasonable bias circuit.

This report studies the global PNP Bipolar Transistor production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for PNP Bipolar Transistor, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
