## Abstracts

The global Point of Care 3D Printing market size is expected to reach \$ 1915 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

To address the problems of cumbersome manufacturing processes, inability to respond immediately to personalized needs, and supply delays in emergency scenarios associated with traditional medical supplies, point-of-care 3D printing equipment emerged. Since its advent in the early 21st century, point-of-care 3D printing has witnessed significant development in bedside rapid manufacturing and personalized medicine. Currently, point-of-care 3D printing encompasses various methods, including fused deposition modeling, photopolymerization, and selective laser sintering, and is widely used in hospital emergency rooms, operating rooms, community healthcare, and disaster relief. It is capable of rapidly printing personalized implants, surgical guides, and emergency supplies, significantly improving nursing efficiency and patient outcomes.

Point-of-care 3D printing is reshaping the medical care paradigm through personalized customization, rapid iteration, and material innovation. Despite facing technological, regulatory, and cost challenges, through industry-academia-research collaborative innovation, a sound standards system, and talent cultivation, it is expected to unleash enormous value in the fields of biopharmaceuticals, precision surgery, and rehabilitation medicine. In the future, with breakthroughs in smart materials, bioprinting, and digital twin technologies, this technology will drive the transformation of healthcare from 'disease treatment' to 'health management,' ultimately realizing the vision of 'one device per person' in precision medicine.
