## Abstracts

The global Point Source Carbon Capture System market size is expected to reach \$ 8215 million by 2032, rising at a market growth of 7.3% CAGR during the forecast period (2026-2032).

Point Source Carbon Capture System is an integrated industrial system designed to capture carbon dioxide directly from concentrated emission sources such as power plants, cement kilns, steel mills, and chemical facilities before the CO<sub>2</sub> is released into the atmosphere. The system typically employs technologies such as post-combustion, pre-combustion, or oxy-fuel capture to separate CO<sub>2</sub> from flue gases. Upstream, it relies on capture solvents or sorbents, membranes, compressors, heat-exchange equipment, and process control systems; downstream, the captured CO<sub>2</sub> is compressed and conditioned for transport, utilization, or permanent storage within CCUS value chains, supporting industrial decarbonization and emissions-reduction targets.
