According to our (Global Info Research) latest study, the global Polarization Image Sensor market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Polarization Image Sensor is a sensor that captures the direction of vibration of light waves, i.e. polarization information, which is not directly perceived by the human eye. This sensor detects changes in the direction of vibration when light strikes the surface of an object, thereby enabling functions such as object shape recognition and elimination of interference from reflected light. Polarization image sensors capture the direction of vibration of light waves and, unlike conventional image sensors, provide additional polarization information, which helps to achieve more accurate detection and analysis.
