According to our (Global Info Research) latest study, the global Pollution Control Booms market size was valued at USD 67 million in 2023 and is forecast to a readjusted size of USD 81 million by 2030 with a CAGR of 2.8% during review period.

Pollution control booms, often referred to as oil spill containment booms or simply containment booms, are specialized floating barriers or structures used in bodies of water to control and mitigate the spread of pollutants, particularly oil and chemical spills. These booms are designed to create a physical barrier that contains and diverts the spilled substance, preventing it from spreading further and causing environmental damage. Pollution control booms are crucial tools in environmental protection and response to marine and aquatic pollution incidents.

Growing environmental awareness and concerns about the impact of pollution on aquatic ecosystems and coastal regions drove the demand for pollution control booms as a preventive measure and as part of emergency response plans.
