According to our (Global Info Research) latest study, the global Pollution Control Catalyst market size was valued at US\$ 9809 million in 2024 and is forecast to a readjusted size of USD 13560 million by 2031 with a CAGR of 4.8% during review period.

A Pollution Control Catalyst is a substance or material that is used to reduce or eliminate harmful pollutants from industrial emissions, vehicle exhausts, or other sources of pollution. It is typically used in catalytic converters, which are devices installed in vehicles and industrial facilities to convert harmful pollutants into less harmful substances before they are released into the atmosphere.

The pollution control catalyst works through a process called catalysis, where it facilitates chemical reactions that convert harmful pollutants, such as nitrogen oxides (NO_x), carbon monoxide (CO), and volatile organic compounds (VOCs), into less harmful substances like nitrogen, carbon dioxide, and water vapor. This process occurs at high temperatures and is facilitated by the catalyst, which is usually made of metals such as platinum, palladium, and rhodium.

The use of pollution control catalysts has been instrumental in reducing air pollution and improving air quality in many parts of the world. They are particularly effective in reducing emissions from vehicles, power plants, and industrial processes that produce significant amounts of pollutants.
