According to our (Global Info Research) latest study, the global Polyacrylamide Nanospheres market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Polyacrylamide nanospheres are a type of nano-scale granular material made of polyacrylamide, which has excellent physical and chemical properties. It exhibits extremely strong adsorption capacity and rheological properties through its high specific surface area and adjustable particle size. In the tertiary oil recovery process of oil fields, polyacrylamide nanospheres can improve oil displacement efficiency, regulate the water injection flow path by blocking the formation pores, and increase the recovery rate. In addition, it can be used to adsorb heavy metals and organic pollutants and purify water quality in environmental pollution control. The advantages of polyacrylamide nanospheres include their biocompatibility, chemical stability, and surface functionalization properties. They can be modified according to different needs and are a functional material with wide application potential.
