Abstracts

The global Polyacrylamide(PAM) for Wastewater Treatment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The polyacrylamide for wastewater treatment has the following characteristics: flocculation, precipitation, improved treatment effect, and environmental protection. By dissolving the polyacrylamide into a solution of appropriate concentration, it is fully mixed and stirred with wastewater to make it fully contact with suspended solids. Then, the flocculated suspended solids are separated from the wastewater through sedimentation, filtration and other processes, so as to effectively purify wastewater, remove suspended solids and impurities, and improve water quality and environmental sustainability.

The polyacrylamide for wastewater treatment is a flocculant or precipitant, which is used to promote the coagulation and sedimentation of suspended solids and impurities in wastewater, so as to achieve the purpose of purifying water.
