Abstracts

The global Polybenzimidazole Film market size is expected to reach \$ 575 million by 2032, rising at a market growth of 8.7% CAGR during the forecast period (2026-2032).

Polybenzimidazole (PBI) Film is a high-performance polymer film made from polybenzimidazole resin, known for its exceptional thermal stability (continuous use above 400 °C), inherent flame resistance, high mechanical strength, and excellent chemical resistance. The supply chain begins with upstream petrochemical intermediates such as aromatic tetraamines and dicarboxylic acids, which are polymerized into PBI resin by specialized chemical manufacturers including Celanese Corporation (a key global producer of PBI under the PBI Performance Products segment). In the midstream stage, the resin is dissolved in strong acids and processed via solution casting or extrusion to form thin PBI films, followed by thermal imidization and finishing treatments to achieve desired thickness, dielectric, and mechanical properties. Downstream, PBI films are supplied to advanced applications in aerospace (thermal insulation, wire coatings), electronics (high-temperature flexible circuits, insulation films), energy (fuel cells, battery separators), and industrial sectors requiring extreme heat and chemical resistance, with distribution handled either directly by manufacturers or through specialty material distributors serving high-end engineering markets. In 2025, global Polybenzimidazole Film output was about 6,400 tons with 9,000 tons of capacity, average prices of USD 40,000–120,000 per ton, and gross margins around 41%.
