According to our (Global Info Research) latest study, the global Polybenzoxazine Resins market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Polybenzoxazine resins are a class of high-performance phenolic resins which are utilized in the structural and engineering applications because they possess good flame retardance and thermal properties of phenolic resins, including high mechanical properties, such as good sound and noise absorption.

Polybenzoxazine resins are synthesized from phenol or substituted phenols, aldehyde, such as formaldehyde, acid aldehyde, or pyromucic aldehyde, and amine groups. They can be synthesized via either solvent or solventless technology. Benzoxazine is an intermediate from the oxygen-containing heterocyclic structures, synthesized from phenols, amines, and paraformaldehyde as raw materials. Its formation requires the ring-opening polymerization under the action of heating and / or catalyst, with no small molecules being released during the polymerization process. This process forms a nitrogen-like and phenolic resin-like network structure of the polymer, namely polybenzoxazine or benzoxazine resin.
