The global Polycarboxylate Dental Adhesives market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Polycarboxylate dental adhesive is a dental restorative material used to fix dental restorations (such as dental fillings, dentures, bridges, etc.) in combination with the tooth surface, thereby restoring the shape, function and appearance of the tooth. Its main component is polycarboxylic acid, which is a high molecular compound with excellent adhesion and durability. Polycarboxylate dental adhesives bond to the tooth surface enamel and dentin to form a strong bond that holds the restoration firmly in place. The advantages of polycarboxylate dental adhesives are that the bonding process is simple, the bonding time is short, and it can be used on a variety of tooth restoration materials. In addition, it can improve the adhesion between the restoration and the tooth, reduce the chance of microorganisms entering the restoration, thereby protecting the tooth from secondary decay and dental caries
