# **Abstracts**

According to our (Global Info Research) latest study, the global Polarizing Cube Beamsplitters market size was valued at USD 212 million in 2023 and is forecast to a readjusted size of USD 364.2 million by 2030 with a CAGR of 8.0% during review period.

Polarizing Beamsplitters are used to split unpolarized light into two polarized parts. Polarizing Beamsplitters are Beamsplitters designed to split light by polarization state rather than by wavelength or intensity. Polarizing Beamsplitters are often used in semiconductor or photonics instrumentation to transmit p-polarized light while reflecting s-polarized light. Polarizing Beamsplitters are typically designed for 0° or 45° angle of incidence with a 90° separation of the beams, depending on the configuration. Cube beamsplitters are constructed using two typically right angle prisms. The hypotenuse surface of one prism is coated, and the two prisms are cemented together so that they form a cubic shape. To avoid damaging the cement, it is recommended that the light be transmitted into the coated prism, which often features a reference mark on the ground surface.
