## Abstracts

The global Polycrystalline Ceramic YAG market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

High-purity Yttrium Aluminum Garnet (YAG) ceramics enable the development of high output, solid state lasers critical to the function of numerous technologies. YAG laser crystals have extraordinary optical properties, offering substantial laser performance for numerous applications, including:

### Dermatology

YAG laser mediums are used in a wide variety of dermatological applications, including the treatment of benign pigmented lesions (tattoos) vascular lesions, and sarcomas and skin tumors.

### Ophthalmology

YAG laser mediums are used in multiple ophthalmic applications. They are commonly used to treat posterior capsular opacification after cataract surgery, to create a peripheral iridotomy in patients with narrow angles or angle-closure glaucoma, as well as numerous other applications.

### Industrial Marking and Machining

YAG laser crystals are used in a wide variety of industrial marking and machining applications, including the cutting and welding of semiconductors and steel. They are also used to engrave and etch various metals and plastics, and for making subsurface

markings in transparent acrylic or glass.

## Laser Rangefinders and Laser Designators

Nd:YAG laser mediums are commonly used for high power rangefinding and telemetry for military, aerospace and many other applications.

## Light Detection and Ranging

Efficient, scalable LiDAR system designs employ “passive Q-switch” lasers that rely upon YAG crystals. Light detecting and ranging (LiDAR) sensors are widely regarded to be an essential technology for state-of-the-art Advanced Driver Assistance Systems (ADAS) and self-driving vehicle technologies.
