## Abstracts

According to our (Global Info Research) latest study, the global Polyester Printer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Polyester is one of the artificially made fabrics, used in the digital textile printing industry, that is extracted from terephthalic acid and alcohol at high temperature. The extracted material is then dried and cut off into chips only to melt later and stretch it 5 times its size. The process gives birth to thread like strands which are then woven to make different products. Polyester is digitally printed using a process called dye-sublimation. A textile dye (disperse is used for polyester) is printed onto a paper. The paper is especially made for digital printing. The image is printed onto the paper in the reverse. Once the paper is printed it is placed onto the surface of the textile.
