Abstracts

The global Polyester Printer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Polyester is one of the artificially made fabrics, used in the digital textile printing industry, that is extracted from terephthalic acid and alcohol at high temperature. The extracted material is then dried and cut off into chips only to melt later and stretch it 5 times its size. The process gives birth to thread like strands which are then woven to make different products. Polyester is digitally printed using a process called dye-sublimation. A textile dye (disperse is used for polyester) is printed onto a paper. The paper is especially made for digital printing. The image is printed onto the paper in the reverse. Once the paper is printed it is placed onto the surface of the textile.

This report studies the global Polyester Printer production, demand, key manufacturers, and key regions.
