Abstracts

The global Polyetheramine and Polyether market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Polyether amines and polyethers are both oxygenated polymers, but they have different molecular structures and application areas.

Polyether amines are a class of polymers that contain ether bonds and amine groups in the main chain of the molecule. Polyether amines are characterized by their adhesive properties, high viscosity and long molecular chains, so they are often used as high-strength adhesive and curing agent substances in applications. Polyether amines have a wide range of applications in the construction, medical, and automotive manufacturing industries.

Applications of polyether amines: Polyether amines are widely used in epoxy resin hardeners, protective coatings for transportation rails, clean waterproof coatings for factories, floor coatings, functional fibers, and encapsulation materials for electronic components.

Polyether is a polymer containing oxygen elements, unlike polyetheramine, which does not contain amine groups and is more commonly used in other applications. Polyethers are characterized by short molecular chain lengths, softness, and ease of processing into a variety of forms, such as films, foams, coatings, printing inks, and plastic products. Polyethers are widely used in cosmetics, packaging, electronics, medical devices and other fields.

Applications of polyether: detergent or defoamer, excipient and emulsifier, wetting

agent, antistatic agent, dispersant, emulsion breaker, papermaking auxiliaries and so on.

In general, the application fields of polyether amine and polyether are very wide, currently has a very wide range of application market, with the continuous development of industrial technology, the application fields of both will continue to expand.
