## Abstracts

In the process of polyethylene production, a small amount of oligomers will be produced, namely low molecular weight polyethylene, also known as macromolecular wax or polyethylene wax for short. Polymer wax is a non-toxic, odorless, non-corrosive, white or slightly yellowish solid with a relative molecular mass of 1800-8000. It can be made into blocks, flakes and powders as required. Polyethylene wax is a kind of lubricant and release agent with good external lubrication. Adding it to rubber and plastics can improve processing efficiency, improve the surface gloss and wear resistance of products, and help fillers and pigments. dispersion.

According to our (Global Info Research) latest study, the global Polyethylene Wax Lubricant market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Polyethylene wax (PE wax), also known as polymer wax, is referred to as polyethylene wax. It is widely used because of its excellent cold resistance, heat resistance, chemical resistance and wear resistance. In normal production, this part of the wax can be directly added to the polyolefin processing as an additive, which can increase the gloss and processing performance of the product. As a lubricant, it has stable chemical properties and good electrical properties. Polyethylene wax has good compatibility with polyethylene, polypropylene, polyvinyl acetate, ethylene-propylene rubber and butyl rubber. It can improve the fluidity of polyethylene, polypropylene and ABS and the release properties of polymethyl methacrylate and polycarbonate. Polyethylene wax has stronger internal lubricating effect than PVC and other external lubricants
