Abstracts

The global Polyglycolic Acid market size is expected to reach \$ 1446 million by 2032, rising at a market growth of 35.4% CAGR during the forecast period (2026-2032).

Polyglycolide or poly(glycolic acid) (PGA), also spelled as polyglycolic acid is a biodegradable, semi-crystalline thermoplastic. It is also the simplest linear, aliphatic polyester. PGA resins are known for their excellent gas barrier properties, relative high strength, and excellent biodegradability. Some grades have a biodegradation rate similar to cellulose and decompose under composting conditions into CO₂ and water within one month. PGA and its copolymers such as poly(lactic-co-glycolic acid), and poly(glycolide-co-caprolactone) are used in a number of applications. Due to PGA's very low permeability to O₂ and CO₂, it can be used as a packaging film for oxygen sensitive products, for example as an interlayer between two polyester films. Other important applications include shale gas extraction and other industrial processes as well as synthetic fast absorbable sutures for internal surgeries.

Global core polyglycolic acid manufacturers include Kureha and Shanghai Pujing Chemical. North America is the largest market, with a share over 45%, followed by China and Europe with the share about 23% and 11%. In terms of product type, industrial grade is the largest segment, with a share over 50%. And in terms of application, the largest application is oil and gas industry, followed by medical industry.

With the commissioning of many large-scale industrial-grade projects in China, such as Sinopec Guizhou Energy Chemical, Sinopec Hubei Fertilizer, Guoneng Mengxi Coal Chemical, Inner Mongolia Jiutai, Inner Mongolia Rongxin Chemical, Anhui Haoyuan Chemical, etc., the global share of industrial-grade PGA will become very high. At the same time, the product application areas will undergo tremendous changes.
