According to our (Global Info Research) latest study, the global Polyimide Electrostatic Chuck for Semiconductor and Flat Panel Equipment market size was valued at US\$ 16.5 million in 2024 and is forecast to a readjusted size of USD 22.5 million by 2031 with a CAGR of 5.1% during review period.

A Polyimide Electrostatic Chuck is a specialized device designed for securing and supporting wafers during semiconductor manufacturing processes. It utilizes polyimide, a high-performance polymer known for its excellent thermal stability, mechanical strength, and chemical resistance. By applying voltage between electrodes, it generates an electrostatic field that creates a uniform distribution of electrostatic force on the surface, firmly holding the wafer in place on the worktable. This ensures the wafer remains stable throughout the processing steps.

The electrostatic clamping method not only provides high-precision positioning, ensuring accurate placement of the wafer during processing but also minimizes the risk of surface scratches or particulate contamination that can occur with mechanical clamping. Additionally, polyimide materials can operate effectively over a wide temperature range, making them suitable for various processing environments, including high-temperature treatments.

Therefore, in fields such as semiconductor wafer processing, flat panel display manufacturing, and optical element handling, the Polyimide Electrostatic Chuck is an essential tool. It guarantees the safety and quality of the wafer, especially in high-

precision operations like photolithography, etching, and deposition.

This report counts polyimide electrostatic chucks used in semiconductor equipment and flat panel equipment.

Polyimide electrostatic chucks (ESC) have gained significant favor among customers due to their notable cost advantages. Globally, there are approximately 7 to 8 major manufacturers, with Japan's TOMOEGAWA Company being the leading supplier. TOMOEGAWA's products, primarily single-level designs, can operate at temperatures up to 200°C and are priced between \$2,000 and \$3,000 on average, mainly supplying OEM products to Tokyo Electron. In contrast, ceramic electrostatic chucks typically have a much higher market price, ranging from \$20,000 to \$30,000. Despite this, polyimide ESCs can achieve similar performance levels, operating effectively at around 200°C, making them highly cost-effective for applications requiring high performance but limited budgets.

Polyimide material exhibits excellent thermal stability and mechanical strength, maintaining performance across a wide temperature range, which is crucial for various semiconductor manufacturing processes, including high-temperature treatments. Additionally, polyimide ESCs use voltage-induced electrostatic forces to provide uniform clamping, ensuring that wafers remain stable throughout processing. This results in high-precision positioning, reducing risks of surface scratches or particle contamination. The electrostatic clamping method is well-suited for high-precision operations such as lithography, etching, and deposition, ensuring wafer safety and processing quality. Creative Technology Corporation, the second-largest global supplier, has achieved annual sales of 1,000 units for one of its models due to its simple base design, single-level structure, and competitive price point of about \$2,000, further demonstrating the technical and market

Although polyimide films tend to degrade and may require replacement or maintenance every 3 to 4 months, their straightforward design makes replacement and maintenance more convenient, minimizing downtime and enhancing production efficiency. In comparison, ceramic electrostatic chucks can last 2 to 3 years but come with significantly higher initial investment costs. In terms of market share, the top two Japanese companies—TOMOEGAWA and Creative Technology Corporation—dominate over 80% of the market. The remaining share is divided among several Korean companies, another Japanese company, and a joint venture, each holding relatively smaller portions. Therefore, polyimide electrostatic chucks stand out in the market due to their cost-effectiveness, superior material properties, and ease of maintenance,

making them an ideal choice for many customers.
