## Abstracts

According to our (Global Info Research) latest study, the global Polymer-based PV Frontsheet market size was valued at US\$ 265 million in 2025 and is forecast to a readjusted size of US\$ 384 million by 2032 with a CAGR of 5.5% during review period.

A polymer-based PV frontsheet is a lightweight, flexible, and transparent plastic film (often made of materials like fluoropolymers such as Tedlar, ETFE, or specialized PET) used to replace conventional glass in solar modules. These sheets protect the solar cells from environmental factors, reduce module weight for easier installation on weak roofs or in portable applications, and can be customized in shape.

In 2025, global production of Polymer-based PV Frontsheet reached 46.08 million square meters, with an average selling price of USD 5.6 per square meter. Total installed capacity was approximately 70 million square meters, and the industry gross margin was about 15%–25%.

Cost structure: raw materials accounted for about 70%, manufacturing overhead about 23%, and labor costs about 7%.

Industry chain: upstream consists of suppliers of fluorinated polymer monomers, polyester monomers, glass fiber, and other raw materials, while downstream consists of manufacturers of lightweight photovoltaic modules.
