Abstracts

A polymer-coated stent is a medical device used to treat coronary artery disease. Coronary artery disease is a type of cardiovascular disease with common symptoms including angina pectoris and myocardial infarction. Coronary artery disease usually results from plaque buildup inside the arteries, which causes them to narrow or become blocked. A polymer-coated stent is a metal stent covered with a polymer coating. This coating usually contains drugs, called drug-eluting coatings, and its purpose is to prevent arterial restenosis or thrombosis by releasing drugs, thereby improving the success rate of surgery and patient outcomes.
