Abstracts

The global Polymeric Anti-hydrolysis Agent market size is expected to reach \$ 269 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

Polymeric anti-hydrolysis agents are additives specifically designed to improve the hydrolysis resistance and high-temperature and high-humidity resistance of polymer materials (such as PET, PBT, PA, and PU). They work by reacting with the terminal carboxyl groups produced during hydrolysis, inhibiting autocatalytic degradation, and thus extending the service life of plastics, rubbers, adhesives, and other products in harsh environments.

The upstream of the polymeric anti-hydrolysis agent industry chain is based on organic chemical raw materials, mainly including key monomers and intermediates such as isocyanates and diamines.

Global sales are projected to be approximately 9225 tons in 2025, with an average market price of approximately US\$19450 per ton. The industry's gross profit margin is in the range of 15%-30%.

These types of anti-hydrolysis agents chemically block the hydrolysis chain scission process by reacting with the functional groups generated during polymer degradation, thereby improving the service life and performance stability of the final products. With the promotion of sustainable materials and durable plastics within the framework of the green economy, the role of high-efficiency anti-hydrolysis agents in improving the performance of recycled materials is also receiving increasing attention.

For example, the trend towards lightweight and electrified vehicles has led to a continuous increase in the application of polymer materials. These materials are prone to hydrolytic degradation in humid and hot environments, thus driving the market demand for anti-hydrolysis agents. In applications with extremely high safety requirements, such as in construction and electrical wires and cables, anti-hydrolysis

agents help materials resist environmental stress cracking and meet more stringent performance standards.

Industry obstacles mainly include fluctuations in raw material prices, increasing formula complexity, and technological barriers.

This report studies the global Polymeric Anti-hydrolysis Agent production, demand, key manufacturers, and key regions.
