Abstracts

The global Polymeric Membrane for Separation market size is expected to reach \$ 925 million by 2032, rising at a market growth of 3.2% CAGR during the forecast period (2026-2032).

Polymeric membranes for gas separation are devices that use membrane technology to separate different components of gas mixtures. The principle of operation is based on the differences in solubility and diffusion rates of various gases in polymeric membrane materials, allowing some gas components to pass through the membrane while others are blocked. This technology is widely used in natural gas processing, air separation, hydrogen recovery, CO₂ capture, and other applications.

Polymeric membranes for gas separation offer advantages such as simple operation, high energy efficiency, and compact design, making them particularly suitable for low-energy, small-scale processing systems. As environmental protection and energy recovery demands increase, the importance of polymeric membrane gas separation technology in industrial applications is growing.

Polymeric membranes for gas separation have been widely used in the past few decades, and with the advancement of global environmental policies and changes in energy demand, the market continues to grow. Currently, the main applications of gas separation membranes include oxygen-nitrogen separation, CO₂ capture, hydrogen recovery, and natural gas decarbonization. In these areas, membrane technology has become one of the mainstream separation methods, particularly in natural gas processing and CO₂ capture, where membrane technology holds a significant market share due to its efficiency and low energy consumption.

With continuous advancements in membrane technology, the performance of polymeric membranes has improved significantly. Modern gas separation membranes not only offer good selectivity and permeability but also show considerable improvements in durability and stability. For example, the separation of CO₂ and nitrogen using polymeric membranes has proven to be more effective than traditional compression and adsorption technologies.
