According to our (Global Info Research) latest study, the global Polymixin market size was valued at USD 241.8 million in 2023 and is forecast to a readjusted size of USD 300.6 million by 2030 with a CAGR of 3.2% during review period.

Polymyxins are antibiotics, with a general structure consisting of a cyclic peptide with a long hydrophobic tail. They disrupt the structure of the bacterial cell membrane by interacting with its phospholipids. They are produced by nonribosomal peptide synthetase systems in Gram-positive bacteria such as *Paenibacillus polymyxa* and are selectively toxic for Gram-negative bacteria due to their specificity for the lipopolysaccharide molecule that exists within many Gram-negative outer membranes. At least eleven different members of the polymyxin group have been identified and they are designated by a suffix letter. They demonstrate specific activity against gram-negative bacteria such as *Proteus vulgaris*, *Escherichia coli*, *Hemophilus influenzae*, *Aerobacter aerogenes*, *Klebsiella pneumoniae* and especially *Pseudomonas aeruginosa*.

Polymyxins B and E (also known as colistin) are common types of polymyxins. Polymyxins B is used for the treatment of human Gram-negative bacterial infections, while polymyxins E is used for animal husbandry.
