## Abstracts

According to our (Global Info Research) latest study, the global Polypropylene Compatibilizer market size was valued at US\$ 1653 million in 2025 and is forecast to a readjusted size of US\$ 2714 million by 2032 with a CAGR of 7.4% during review period.

Polypropylene compatibilizers are functional modified materials made by introducing polar functional groups (such as maleic anhydride, acrylic acid, or epoxy groups) into polypropylene (PP) as a matrix through grafting or copolymerization. They are mainly used to improve the interfacial compatibility between polypropylene and polar polymers, glass fiber, or inorganic fillers. Because polypropylene itself is a non-polar material, its interfacial bonding is weak when blended with materials such as nylon (PA), polyester (PET), glass fiber, or calcium carbonate. Adding PP compatibilizers can form physical or chemical bonds between the two phases, thereby improving the material's mechanical properties, impact strength, heat resistance, and processing stability. Polypropylene compatibilizers are widely used in lightweight automotive components, appliance housings, modified plastics, cable materials, and packaging materials, and are important functional additives for improving the performance of multiphase composite materials. In 2025, global sales of polypropylene compatibilizers were approximately 218.69 thousand tons.

Polypropylene compatibilizers are functional modified materials made by grafting maleic anhydride (MAH), acrylic acid, or other polar functional groups onto polypropylene (PP) as a matrix. They are primarily used to improve the interfacial compatibility between polypropylene and polar polymers, glass fibers, or inorganic fillers. In multiphase blend systems, PP compatibilizers can enhance interfacial bonding strength, improve the mechanical properties, impact resistance, and processing stability of the material,

making them key functional additives in the modified plastics industry chain. With the increasing application of lightweighting in automobiles, upgrading in home appliances, and new energy materials, the market demand for polypropylene compatibilizers continues to grow.

In recent years, global modified polypropylene production has been continuously increasing, driving the steady expansion of the compatibilizer market. The automotive industry is the largest application area, with bumpers, dashboard frames, door panels, and structural components extensively using glass fiber reinforced or filled modified PP materials, where compatibilizers play a crucial role. At the same time, the increasing requirements for material strength and heat resistance in the home appliance, electronics, and packaging sectors are also driving up the usage of PP compatibilizers. With the increasing penetration rate of new energy vehicles and the accelerating trend of vehicle lightweighting, the application ratio of glass fiber reinforced and high-performance modified PP materials is further increasing, bringing structural growth opportunities to the compatibilizer market.

From a product structure perspective, maleic anhydride-grafted polypropylene (PP-g-MA) remains the mainstream product in the market, occupying a high market share. Depending on the application, it can be further subdivided into compatibilizers for filler modification, compatibilizers for glass fiber reinforced systems, and reactive compatibilizers for engineering plastic blends. In recent years, the demand for products with high reactivity, low volatility, low odor, and high stability has increased significantly. As downstream products develop towards high-end products, companies are placing higher demands on their grafting technology control capabilities and product consistency, and the product structure is gradually upgrading towards higher added value.

In terms of the industry chain, the upstream consists of basic polypropylene resin and functional monomers (such as maleic anhydride), the midstream consists of grafting modification and granulation companies, and the downstream consists of modified plastics plants and end-product manufacturing industries. Regionally, Asia is the world's largest production and consumption market, with China showing strong demand in the automotive and home appliance sectors; Europe and North America, on the other hand, have stable demand in high-performance engineering plastic modification. The industry competition is characterized by 'large-scale enterprises dominating and technology-driven companies focusing on niche markets,' with companies possessing stable grafting processes, formulation development capabilities, and collaborative development capabilities with customers having a greater competitive advantage.

Looking ahead, the global polypropylene compatibilizer market will be driven by three core factors: first, the demand for material upgrades brought about by automotive lightweighting and the development of new energy vehicles; second, the increase in modified polypropylene production and the trend towards high performance; and third, environmental policies promoting the application of low-VOC and low-odor materials. Overall, the market will shift from traditional filler modification to high-performance composite materials.
