The global Polyurethane Intravenous Indwelling Needle market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Polyurethane intravenous indwelling needle is a medical device used for intravenous therapy. It is a flexible catheter made of polyurethane material that is inserted into a vein to provide a channel for the delivery of drugs, liquids, or blood products. Polyurethane intravenous indwelling needles have several advantages over other types of catheters, such as those made of silicone or PVC. Polyurethane is a biocompatible material that is unlikely to cause venous irritation or inflammation. It is also more flexible and durable, reducing the risk of catheter displacement or breakage. In addition, polyurethane catheters can be used for longer periods of time than other types of catheters, which can reduce the need for frequent catheter replacement.
