Abstracts

Population screening is the process of assessing the prevalence of a particular trait in the entire population or in a subgroup of the population. Screening is the process of identifying healthy people who may have an increased chance of a disease or condition. The screening provider then offers information, further tests and treatment. This is to reduce associated problems or complications. Population screening is being adopted as a major strategy owing to benefits such as early patient identification, which can help reduce the burden of the higher treatment cost of diseases at later stages.
