Abstracts

Porcine collagen membrane refers to a type of biomaterial derived from the collagen of pigs. Collagen is a protein found in connective tissues such as skin, bone, and tendons, and it serves as a scaffold for cell growth and tissue regeneration. Porcine collagen membranes are commonly used in medical and dental applications, particularly in oral surgery and periodontal procedures. These membranes are often used as barriers to protect and support the regeneration of soft tissues and bone during surgical procedures. They help to prevent the ingrowth of soft tissue into a surgical site, promote the formation of new tissue, and facilitate wound healing. Porcine collagen membranes are biocompatible, meaning they are well-tolerated by the body and do not typically cause adverse reactions or rejection. Overall, porcine collagen membranes play a valuable role in various medical and dental applications, contributing to improved outcomes and patient care.

According to our (Global Info Research) latest study, the global Porcine Collagen Membrane market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.
