According to our (Global Info Research) latest study, the global Pore Pressure Transducer market size was valued at US\$ 1235 million in 2025 and is forecast to a readjusted size of US\$ 1897 million by 2032 with a CAGR of 6.3% during review period.

The pore pressure transducer is a precise measuring device that converts the pressure of fluids (water and gas) in the pores of porous media such as soil, rock, or concrete into standardized electrical signals. Its core function is to achieve real-time, in-situ, and accurate monitoring of key parameters of the stability and seepage state of engineering rock and soil bodies - pore water (gas) pressure. This solves fundamental safety issues such as inaccurate stability assessment, delayed disaster warning, and insufficient engineering design basis caused by the inability to directly and continuously grasp the internal stress state of rock and soil bodies in water conservancy projects, geological disaster warnings, oil extraction, and underground engineering construction. The upstream supply chain mainly includes the research and precise manufacturing of high-precision sensing chips (such as silicon piezoresistors, vibrating wire elements), special metal diaphragms, corrosion-resistant packaging materials, and signal conditioning circuits; the downstream directly serves rock and soil engineering monitoring units, major infrastructure (dams, bridges, tunnels) owners, oil service companies, and research institutions. By integrating the sensors into monitoring systems or testing equipment, it provides direct and reliable data sources for engineering safety operation, efficient resource extraction, and frontier scientific research. In 2025, the production of pore pressure transducer is approximately 6 million pieces, with an average price of about \$200 per piece, a gross profit margin of about 30%, and a single-line production capacity of 50,000 pieces per year.
