Abstracts

According to our (Global Info Research) latest study, the global Pool Grade Diatomaceous Earth market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

DE is made from Diatomites, which are rough, porous fossilized mineral deposits formed near dried up water. The mineral is a result of dead single-celled algae called diatoms usually found in marine sediments. Diatoms account for ? of all photosynthesis on Earth. The size of each diatom is about the width of a human hair (0.5 mm). While some diatoms float by themselves, many diatoms group together and form suspended chains near the surface of water or attach themselves to rocks or plants under water.

Pool grade (also called filter grade) diatomaceous earth is treated with very high heat in a process called calcination, which changes the silicon dioxide into crystalline silica. Pool grade DE is toxic and should only be used in filtration.
