Abstracts

The global Port Digital Transformation market size is expected to reach \$ 1780 million by 2032, rising at a market growth of 7.8% CAGR during the forecast period (2026-2032).

Port Digital Transformation refers to the process of systematically restructuring and intelligently upgrading all business processes of a port, including terminal operations, logistics collaboration, customs clearance, equipment maintenance, and safety supervision, by comprehensively utilizing next-generation information technologies such as the Internet of Things, big data, artificial intelligence, 5G, and digital twins. Its core objectives are to achieve automated operations, digitalized management, integrated services, and intelligent decision-making. By building a 'smart port' platform, data barriers between shipping companies, customs, trucking companies, and railways are broken down, improving port throughput efficiency, reducing operating costs, enhancing supply chain resilience, and achieving a transformation from traditional labor-intensive to technology-intensive operations.
