According to our (Global Info Research) latest study, the global Port Position Detection System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Port position detection system is a computerized system that tracks the movement of assets within a port. A reliable PDS will enable accurate and reliable position detection of container handling equipment (CHE) and, consequently, containers in complex terminal environments. The system collects data on the location of each CHE, matches it with the yard position and passes it to the terminal operation system (TOS) where it will be assigned to the container being moved.
