## Abstracts

The global Port Position Detection System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Port position detection system is a computerized system that tracks the movement of assets within a port. A reliable PDS will enable accurate and reliable position detection of container handling equipment (CHE) and, consequently, containers in complex terminal environments. The system collects data on the location of each CHE, matches it with the yard position and passes it to the terminal operation system (TOS) where it will be assigned to the container being moved.
