Abstracts

The global Portable Hearing Screener market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

People's ear is made up of three parts—the outer, the middle, and the inner ear. The OAE test is used to find out how well inner ear, or cochlea, works. It measures otoacoustic emissions, or OAEs. These are sounds given off by the inner ear when responding to a sound. There are hair cells in the inner ear that respond to sound by vibrating. The vibration produces a very quiet sound that echoes back into the middle ear. This sound is the OAE that is measured. If people have normal hearing, they will produce OAEs. If their hearing loss is greater than 25–30 decibels (dB), it will not produce these very soft sounds. This test can also show if there is a blockage in outer or middle ear. If there is a blockage, no sounds will be able to get through to the inner ear. This means that there will be no vibration or sounds that come back.

Portable OAE Hearing Screener A small earphone, or probe, is placed in ear. The probe puts sounds into ear and measures the sounds that come back. The test can see the results on the monitor screen.
